Introduction

This summary details the basic health and safety issues associated with handling and keeping animals in schools. Further guidance is provided in CLEAPSS guidance documents GL211- an introduction to keeping and handling animals in school.

Handling Animals

If animals will be handled, the most important issue is the maintenance of good hygiene.

When handling animals:

- Do not consume food or drink,
- Cover any open cuts or abrasions on the exposed skin of hands and arms with waterproof adhesive dressings,
- Wash your hands with soap and water before and directly after handling animals.
- Keep animals away from the face.

Careful handling of small mammals and other animals is most important; the animals should be restrained sufficiently so that, they cannot damage themselves or the handler.

Mammals should be handled daily if possible (unless breeding or nursing when they should be disturbed as little as possible). In this way they will normally become quite tame and accustomed to being handled.

Gloves should not normally be worn unless it is known that an animal for one reason or another is likely to bite or scratch. In this situation a pair of rubber gloves which does not particularly reduce dexterity, is a sensible precaution.

Handling small animals should always be carried out over a table or trough filled with a soft material such as sand / sawdust.

Physical injuries

There is always the danger of bites and scratches, and teachers should check that any animals kept / brought in are docile, friendly and gentle in the presence of children.

Small fingers poked towards the mouths of normally non-aggressive animals may be interpreted as an offering of food and obligingly bitten.

Diseases, parasites and allergies

The likelihood of diseases being passed on from pet animals is low. However allergic reactions to mammals, birds and a few other animals cannot be discounted. These might result from handling the animals or just from being near them and be detected by the development of skin rashes, irritation to the eyes and nose or breathing difficulties.

Hand washing soon after handling animals will help. Teachers should watch for the development of allergic reactions in pupils who come into contact with the animals.

Children known to have allergic reactions to specific animals must, of course, have restricted access to those that may trigger a response. In most cases, an allergic reaction will subside once the animal and the affected person is kept apart; in extreme cases, seek medical advice.

Salmonella bacteria may be carried by reptiles; good hygiene is again required, especially if aquatic reptiles, such as terrapins, are kept.

Good general hygiene and hand washing are essential for risk reduction.

Children under five should not have contact with such reptiles or the environment in which the reptiles live or exercise.

Bringing pets and other animals into school

In addition to the general guidance given above, it is important that suitable arrangements are made in advance for the wellbeing of animals for the short time they are to be on the premises.

When a variety of animals will be together, consider carefully the possibility of unwanted interactions. Animals must be housed properly and separately whilst on the premises; any containers used to transport them must be appropriate and retain the animal securely.

Animal Suppliers

The majority of animals available through reputable suppliers present no hazards that good hygiene procedures cannot address.

In order for there to be minimal risk to humans of diseases being transmitted from animals kept in schools, it is important that animals are obtained from accredited or high-quality sources. Unless these are known to have originated from a reliable source, it will not be possible to be confident that they are disease-free.

Animal Health

If animals are not kept in scrupulously clean conditions, or come into contact with other animals from dubious sources, it will no longer be possible to guarantee that the animals will remain in a disease-free condition.

Holiday times, particularly in primary schools, can obviously create real difficulties.

It is preferable that the animals remain at school and suitable arrangements made for their normal feeding, watering and cleaning. If, however, this is impossible and animals have to be taken out of school at holidays, they should not be sent home with pupils or other people unless all of the following considerations can be satisfied.

- It can be guaranteed that the animals will be looked after as well as usual.
- Whoever is caring for the animals must have all the necessary information, equipment, food, skills, etc.

- Parents must have been informed and given their consent.
- Steps will be taken to ensure that the school's animals will not be able to come into contact with pet animals (cats, dogs, rodents or other mammals).
- That small mammals cannot come into contact with wild rodents (mice, rats, etc.) while off the school premises.

Cleaning and Hygiene

This is clearly important, both for the health of the animals and for those people looking after them. Hands should be washed before and, of course, after cleaning cages, tanks etc. rubber or plastic gloves should preferably be worn.

After removing soiled litter material, cages should be scrubbed with hot water and liquid detergent.

Frequency of cleaning (Small Mammals)

As a general rule, this should be done at least every 10 days. Gerbils produce very little urine and so require relatively infrequent changes. Hamsters produce a little more urine; mice, rats, guinea pigs and rabbits urinate in relatively large amounts. These animals should be cleaned at least once a week. Your nose is always a good guide - cages which are even slightly offensive should already have been cleaned! Arrangements must be made for cages to be cleaned as regularly as normal at holiday times.

Soiled litter disposal Soiled litter should ideally be incinerated; more conveniently it could be sealed in strong plastic bags and placed with other waste in dustbins.

Unsuitable Animals It goes without saying that certain animals present unacceptable risks and should not be brought into schools.

Wild birds and mammals taken, even if legally, from the 'wild' should not be brought into schools directly as they may be harbouring diseases or parasites transmissible to humans.

Prohibition of Birds in School

In line with current health and safety legislation, our school does not permit birds to be kept on-site. Birds pose a particular biosecurity risk: the UK Government has established a national Avian Influenza Prevention Zone (AIPZ) and a mandatory housing order for captive birds, requiring all bird keepers to follow strict hygiene and disease control measures.

Our policy reflects broader health-and-safety guidance on animals in schools: bringing live birds into educational settings increases the risk of disease (such as avian flu), allergies, and zoonotic infections, and requires infrastructure, staffing, and ongoing risk assessments that are beyond the scope of our school's resources.

Therefore, to ensure the health and wellbeing of students, staff, and any animal, and to remain compliant with both welfare and disease-control legislation, no birds (including pet or captive birds) are permitted to be kept in school premises.
